Situation Report: Healthcare Cybercrime

For a medical provider, the effects of a data breach, either malicious or unintentional, can have serious consequences.

Cybercrimes, such as stealing PHI and PII for identity theft, are part of a multi-billion dollar industry.

Such data breaches not only have an immediate financial impact, but the affected HCO can also face a long-lasting loss of reputation and trust. Thus, protecting your enterprise's data assets and developing the ability to respond promptly to cyber threats is an integral component of PHI and PII protection.

About CyberloQ

Grounded in 30+ years of experience providing domestic and international cybersecurity services for the U.S. Government, our patent-pending CyberloQ™ technology is designed specifically to provide a solution for proactive, real-time control of identity governance to protect a HCO's patients, information assets, and the organization's brand reputation.

These statistics identify the need to provide a stronger form of authentication and authorization for access to healthcare data that isn't possible only usernames and passwords.

HIPAA requires that healthcare providers ensure that safeguards be in place to protect patients' PHI. This includes any unauthorized disclosure of information that is maintained or transmitted electronically; a requirement made all the more burdensome by increasing access from mobile devices.

Secure Multifactor Authentication

Advanced Credit Technologies' patent-pending CyberloQ™ technology adds another tool to the healthcare provider's arsenal to fight unauthorized access to protected resources. Rather than take action after a breach, CyberloQ uses Multi-Factor Authentication (MFA) to pro-actively ensure that only authorized users, on approved devices and within designated locations, can access your HCO's protected data.

Iron Clad Security

We are currently developing enhancements to add additional layers of security to CyberloQ's current MFA solution by including biometrics for high-level access security.

By using CyberloQ's MFA technology, HCOs can exceed HIPAA privacy and security guidelines by ensuring that healthcare data is not accessed from unauthorized locations, on unapproved devices, or by unauthorized personnel.

Healthcare records, essential in case of an audit by the HHS OCR for HIPAA compliancy, are recorded in a global administrative console that is easily accessible by your HCO administrators.

Surveillance Perimeter

CyberloQ enabled client accounts will always be in an "inactive" state until they use their mobile device (a smartphone, laptop or tablet) and a PIN as a two-factor authentication credential to access any protected data resource, PHI or PII.

Data protected by CyberloQ can be accessed only by employees or patients who have been registered with the healthcare provider's CyberloQ enabled database such as Active Directory or LDAP.

The medical provider also uses CyberloQ's administrator-defined geofencing capability to ensure that the user/device is within a certain geographical perimeter before access is granted. This location can be as large as a city or as small as a room, providing the ultimate perimeter surveillance scalability.

A user account will only receive access within the geofence perimeter. This feature is particularly important in a world where medical data is increasingly accessed via "always-on" active account logins.

Mobile App

Supports GPS and Location Permissions

Global View Console

Featuring comprehensive details and reporting for each information activation across users, devices, and locations.
